Showskills

(Get Freelancing Services through the Internet)

TEAM MEMBERS: **Raman Ailwadhi (19103061) , Viraj Reathia (19103075), Aman (19103013), Rohit Bajaj (19103017)**

Problem Statement: A huge amount of people such as teachers, artists, graphics designers, animators and translators lost their jobs due to Covid-19 and are now struggling to get work so they can earn money to sustain their livelihoods. Moreover, a lot of people went back to their hometowns due to the pandemic, thus leading to situation non-availability of people with above listed professions. Moreover, several recruiters know some people who can provide the services given above but they are not happy with their performance or their charges and want to have more options so they can hire a person with the quality and charges they feel are appropriate.

Proposed Solution: Our team's solution would be to make a platform called Showskills which can connect freelancers with recruiters so they can satisfy each other's needs. This will make sure that freelancers get employment opportunities and recruiters get better quality of services.

Overview:

In this project, a freelancer's location, skills, and other important details such as identity and contact info will be stored in a database along with the recruiters' location, payment details, needs and address so they can seamlessly connect to each other whenever they want. The project can be extended to all over the world to connect freelancers with recruiters.

How Project relates to this course: We will be using database to store data of freelancers, recruiters, including their skills, requirements and bank details. Secondly, we will design DFD, decision trees and perform analysis, and that covers Engineering Analysis and Design part.
